# **Encounter Design**

- Encounters are systems
- Lots of guys
- Lots of things to do
- The system reacts in interesting ways
- The system collapses in interesting ways

An encounter is a complicated dance with lots of dancers

How is this dance choreographed?

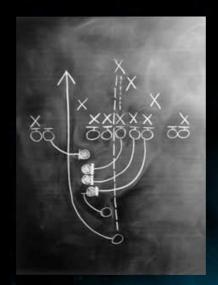

# Choreography 101

- The dance is about the illusion of strategic intelligence
- Strategy is environment- story- and pacing-dependent

Designer provides the strategic intelligence

Al acts smart within the confines of the plan provided by the designer

NON FACETE NOBIS CALCITRARE VESTR

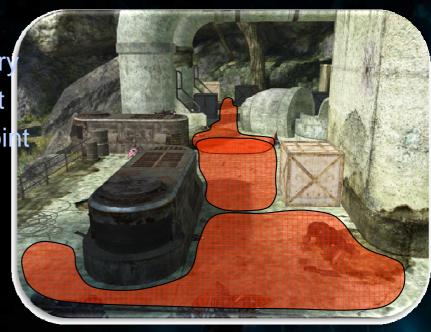

## The Canonical Encounter

#### Two-stage fallback

- Enemies occupy a territory
- Pushed to "fallback" point
- Pushed to "last-stand" point
- Player "breaks" them
- Player finishes them off

#### ... plus a little "spice"

- snipers
- turrets
- dropships

NON FACETE NOBIS CALCITRARE VESTI

## Task

The mission designers' language for telling the Al what it should be doing

#### Halo:

- Territory
- Behavior
  - aggressiveness
  - rules of engagement
  - player following

Changing task moves AI around the encounter space

NON FACETE NOR'S CALCITRARE VESTE

#### The Control Stack

Encounter Logic

Task

Mission-designers script sequence of tasks

Mission designers

Al engineers, Al designers Within the task, the Al behaves autonomously

# **Halo 2: The Imperative Method**

NON FACETE NORIS CALCITRARE VESTRY

# The Imperative Method

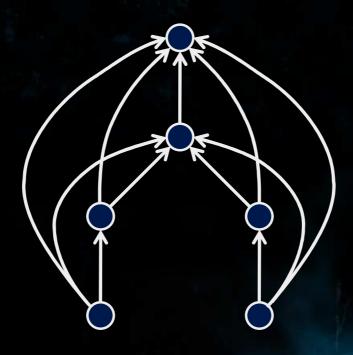

Give the designers an FSM construction tool

NON FACETE NOR'S CALCITRARE VEST

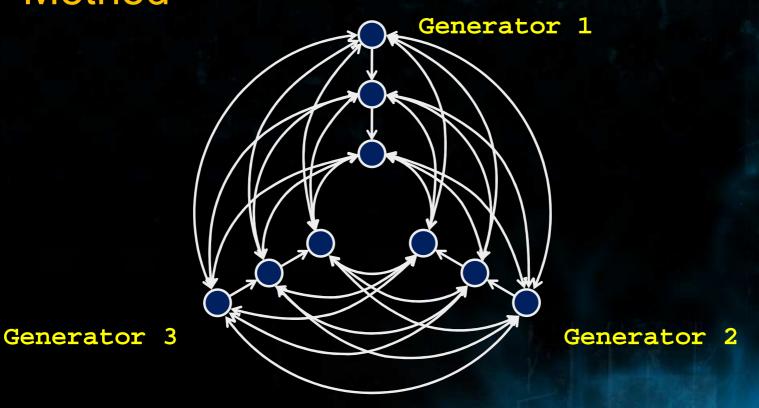

# Problems with the Imperative Method

NON FACETE NUBIS CALCITRARE VES

# Problems with the Imperative Method

# Problems with the Imperative Method

#### For Halo 3:

- Larger encounters
- More characters
- More open spaces
- More avenues of attack

NON FACETE NOBIS CALCITRARE VEST

# **Halo 3: The Declarative Method**

NON FACETE NORIS CALCITRARE VESTRA

## The Declarative Method

The new approach:

Enumerate "tasks that need doing" in the environment

Let the system figure out who should perform them

NON FACETE NOBIS CALCITRARE VESTI

# The Declarative Method

#### Not without precedent

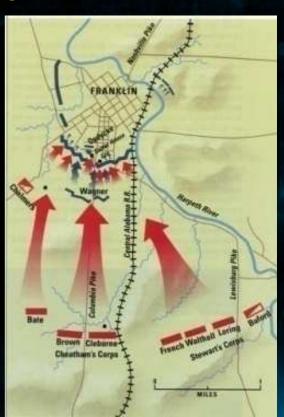

Similar to "affordances"

## The Declarative Method

#### Tasks have structure

- Relative priorities
  - "The most important thing is to guard the door, but if you can, also guard the hallway"
- Are made up of sub-tasks
  - "Guarding the hallway means guarding the front, the middle and the rear of the hallway."

NON FACETE NOBIS CALCITRARE VESTR

**Behavior Trees** 

(Handling Complexity in the Halo 2 AI, GDC 2005)

root

# hide cover grenade melee shoot uncover pursue idle sleep

#### Takeaways:

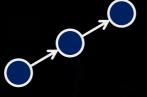

- 1. Prioritized-list decision scheme
- 2. Behaviors are self-describing

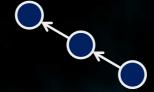

We are not making a *single* choice. We are finding a *distribution* across *all* choices.

# Task Trees?

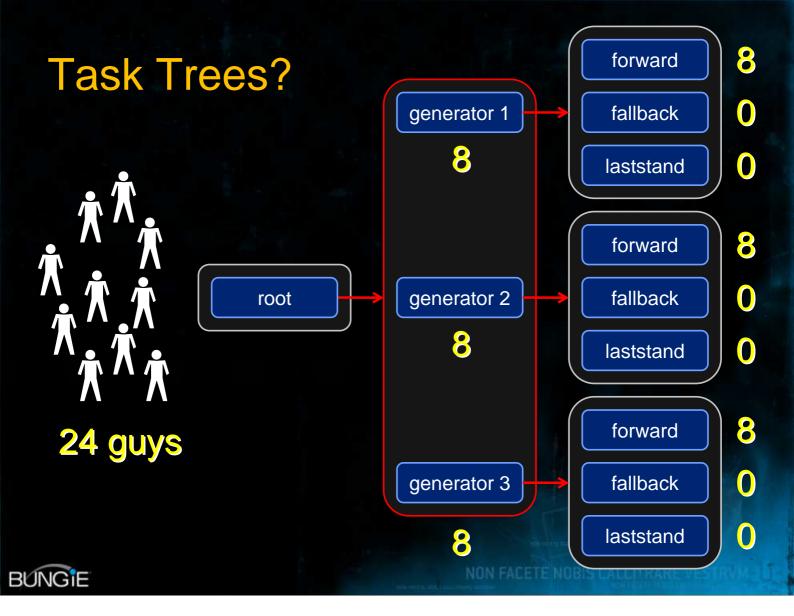

Generator 3

Generator 2

NON FACETE NOR'S CALCITRARE VESTE

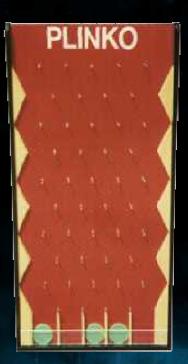

# Halo 3 Al Objectives System

#### The structure:

- A Tree of Prioritized Tasks
- Tasks are self-describing
  - priority
  - activation script-fragments
  - capacities

#### The Algorithm:

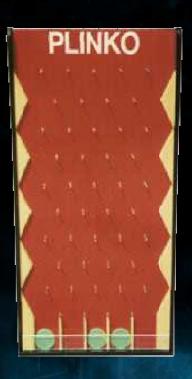

- Pour squads in at the top
- Allow them to filter down to the most important tasks to be filling RIGHT NOW

Basically, it's a plinko machine.

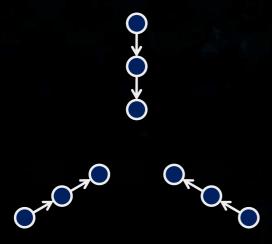

# The Dynamic Plinko Machine

- Tasks turn themselves on and off
- Squads pulled UP, on activation of a higherpriority task
- Squads pushed DOWN, on deactivation of the task they're in

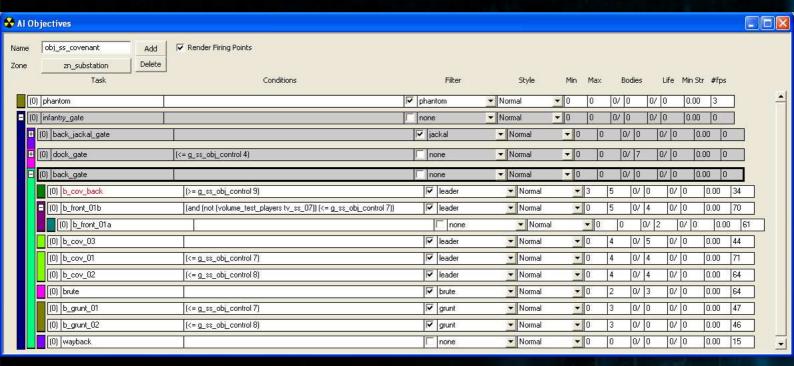

# 3 Generators Revisited

BUNGIE

# Designer UI

- Integration with HaloScript
- Run-time feedback

NON FACETE NOBIS CALCITRARE VI

# The Algorithm

NON FACETE NOBIS CALCITRARE VESTRY

# The Algorithm

- Consider a subtree fragment
- Determine which children are active
  - Squads in inactive tasks assigned back up to parent
- Consider top priority group
- Collect squads to attempt to distribute
  - Squads currently in parent
  - Squads in lower-priority tasks
- Distribute Squads
- Recurse for children in top prioritygroup
- Iterate to next "priority group"

Formally, we have

- set S of n squads
- set **T** of **m** tasks

Now, find a mappin $\mathbf{g}(S) \rightarrow T$ 

#### Two parts:

- 1. Respect Task-Capacity Constraints
- 2. Minimize cost function *H(F)*

NON FACETE NOBIS CALCITR

1. Respect Task-Capacity Constraints

# guys assigned to task  $t \le capacity(t)$ 

... but remember, we're bucketing by squads.

This is called *bin-packing*. And it's NP-Hard.

1. Respect Task-Capacity Constraints

#### Fortunately

- a) there's always Wikipedia
- b) we can live with sub-optimal
- c) we're optimizing not for m, but for H(F)

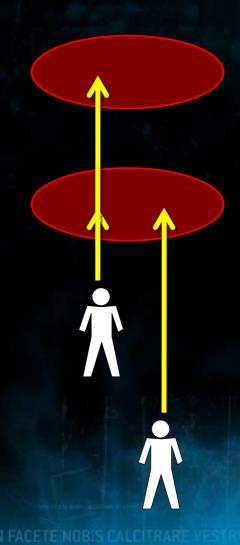

NON FACETE NOBIS CALCITRARE VEST

2. Minimize cost function *H(F)* 

#### Why a cost function?

- Gives us a basis for choosing one distribution over another
- Weigh different concerns
  - don't want to travel far
  - want to act coordinated
  - want to balance the tree
    - want to get near to the

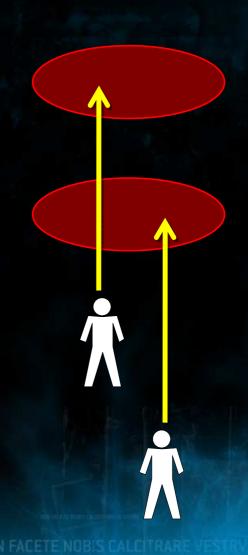

BUNGIE

2. Minimize cost function *H(F)* 

<u>DANGER</u>: All can look really stupid with wrong H(f)

OPPORTUNITY: Designer has abdicated his decision-making authority

2. Minimize cost function H(F)

A class of cost functions:

$$H(F) = \sum_{s} H(s, F(s))$$

We use

$$H(F) = \sum_{s} \text{distance}(s, F(s))$$

NON FACETE NOBIS CALCITRARE VEST

### A Greedy Approach

```
while (S is not empty)

find pair (s,t) that give the minimum
H(s,t) for all S x T (where adding s to t
would not exceed t's capacity)

if (s,t)
   assign(s, t)
   capacity(t) = capacity(t) - size(s)
   S = S - s
else
   end
```

NON FACETE NORIS CALCITRARE VEST

#### A note on Perf

Our algorithm may be  $O(n^2m)$ , but we are redeemed by the fact that n and m are small

#### Other perf measures

- Cache H(s,t) results
- Timeslice entire trees ← Halo3
- Timeslice nodes within trees

NON FACETE NOBIS CALCITRARE VE

# Refinements

NON FACETE NOBIS CALCITRARE VESTRY

#### **Filters**

Particular tasks only available to particular *kinds* of guys

#### E.g.

- Must be of character type X
- Must be in vehicles
- Must NOT be in vehicles
- Snipers

#### "Filters"

- Specify occupation conditions (as opposed to activation conditions)
- "Trivially" implemented as an inf return value from H(s, t)
- Helpful for the "spice"

#### **Further Task Refinements**

#### Activation behavior

- Latch on
- Latch off / exhaustion

#### **Exhaustion behavior**

- Death count
- Living count

#### Assignment behavior

One-time assignment

All of these were designer requests

NON FACETE NOBIS CALCITRARE VE

## **Case Studies**

NON FACETE NOBIS CALCITRARE VESTRY

## Case Study #1: Leadership

## Want to have leaders and followers

- Brute and three grunts
- Brute Chieftan and brute pack

#### Gameplay

- Leaders provide structure to encounter
- Leader death "breaks" followers

## Case Study #1: Leadership

#### Two Parts:

- 1. Leadership-based filters
  - Core task: "leader" filter
  - Peripheral tasks: "NO leader" filter
- 2. Task "broken" state
  - Task does not allow redistribution in or out while broken
  - NPCs have "broken" behaviors

NON FACETE NOBIS CALCITRARE VE

## Case Study #2: Player pickup

Vehicle encounters are not fun without a vehicle

#### Gameplay

• When the player needs a vehicle, allies go pick him up

## Case Study #2: Player pickup

Implementation: one dedicated player-pickup task per encounter

#### Four parts:

- 1. vehicle filter
- 2. player\_needs\_vehicle() script function
- 3. "follow player" task option
- 4. driver player\_pickup behavior

And that's it!

NON FACETE NOBIS CALCITRARE VEST

# Demo (Max Dyckhoff, everybody)

NON FACETE NORIS CALCITRARE VESTRY

## **Summaries**

NON FACETE NORIS CALCITRARE VESTEL

## **Badness Summary**

- Requires designer training
- Sometimes awkward relationship between scripting system and Objectives
- Tying together allied and enemy "fronts" was complicated.
- The squad wasn't always the best level at which to do the bucketing
  - e.g. give a guy a sniper rifle ... shouldn't he then be allowed to occupy a "sniper" task?

## **Technique Summary**

- Declarative approaches are great
  - less direct control, more manageability
- Hierarchies are great
  - more modular
  - better scalability
- Self-describing tasks makes this whole thing O(n) complexity rather than O(n²) (conceptually)

NON FACETE NOBIS CALCITRARE VES

## **Production Summary**

- The Goal: provide a powerful tool for designers to control strategy-level decision-making for a large group of characters
- Flexible enough to incorporate plenty of designerrequested features / modifications
- Great for Prototyping
  - became much more complicated as we neared shippable encounter state
- One-stop-shop for encounter construction

Design of the system driven from the UI outwards

## **Summary Summary**

Not a problem isolated to Halo

As number of NPCs grows, these kinds of techniques will become more and more important

All you need ...

... is H(s,t)

These slides will be available online Feb. 25th, 2008
